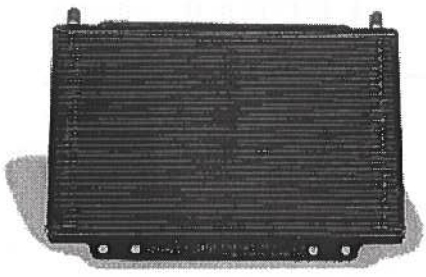
Fluids

Many people overlook one of the most important parts of your car; Your Oil. Most people think that any oil is good oil, but that isnt always the case. Some oils can build up sludge in your motor causing overheating of the block, and lack of power. It is VERY important to change your oil or have it changed every 3,000 miles so this sludge isnt built up.

The better way to go is to go with Synthetic oils. These man made oils provide a better barrier between metal contact and reduce friction considerably more than standard oil. If you arent willing to pay $3.00 per quart, at least go with a half synthetic/half standard mix.

Another way to get good protection is to go with an oil additive such as Prolong. These oil additives form a molecular bond between friction points and dramatically reduce engine wear and temperature.



Investing in an engine oil cooler or Transmission oil cooler is a great idea. Lowering your cars

temperature helps its performance in many aspects, and lengthens the life of your drivetrain.
